$f \circ g$	Composition of the functions f and g

Sometimes we use a function f whose argument is a scalar, but apply it to a vector, matrix, or tensor: $f(\boldsymbol{x})$, $f(\boldsymbol{X})$, or $f(\mathsf{\mathbf{X}})$. This means to apply f to the array element-wise. For example, if $\mathsf{\mathbf{C}} = \sigma(\mathsf{\mathbf{X}})$, then $\mathsf{C}_{i,j,k} = \sigma(\mathsf{X}_{i,j,k})$ for all valid values of i, j and k.
